

1. Assign the value 7 to the variable `guess_me`. Then, write the conditional tests (if, else, and elif) to print the string 'too low' if `guess_me` is less than 7, 'too high' if greater than 7, and 'just right' if equal to 7.?

Ans:

```
1 [1]: guess_me = 7
        if guess_me < 7:
            print('too low')
        elif guess_me > 7:
            print('too high')
        else:
            print('just right')
```

just right

2. Assign the value 7 to the variable `guess_me` and the value 1 to the variable `start`. Write a while loop that compares `start` with `guess_me`. Print too low if `start` is less than `guess_me`. If `start` equals `guess_me`, print 'found it!' and exit the loop. If `start` is greater than `guess_me`, print 'oops' and exit the loop. Increment `start` at the end of the loop.?

Ans:

```
] : guess_me = 7
    start = 1
    while True:
        if start < guess_me:
            print('too low')
        elif start == guess_me:
            print('found it!')
            break
        elif start > guess_me:
            print('oops')
            break
        start += 1
```

too low  
too low  
too low  
too low  
too low  
too low  
found it!

3. Print the following values of the list [3, 2, 1, 0] using a for loop.?

Ans:

```
9]: lst = [3,2,1,0]
    for value in lst:
        print(value)
```

3  
2  
1  
0

4. Use a list comprehension to make a list of the even numbers in range(10)?

Ans:

```
[13]: even = [number for number in range(10) if number % 2 == 0]
      even
```

```
:[13]: [0, 2, 4, 6, 8]
```

5. Use a dictionary comprehension to create the dictionary squares. Use range(10) to return the keys, and use the square of each key as its value.?

Ans:

```
1]: squares = {key: key*key for key in range(10)}
      squares
```

```
1]: {0: 0, 1: 1, 2: 4, 3: 9, 4: 16, 5: 25, 6: 36, 7: 49, 8: 64, 9: 81}
```

6. Construct the set odd from the odd numbers in the range using a set comprehension (10).?

Ans:

```
]: odd = {number for number in range(10) if number % 2 == 1}
      odd
```

```
]: {1, 3, 5, 7, 9}
```

7. Use a generator comprehension to return the string 'Got ' and a number for the numbers in range(10). Iterate through this by using a for loop.?

Ans:

```
5]: for thing in ('Got %s' % number for number in range(10)):
      print(thing)
```

```
Got 0
Got 1
Got 2
Got 3
Got 4
Got 5
Got 6
Got 7
Got 8
Got 9
```

8. Define a function called good that returns the list ['Harry', 'Ron', 'Hermione'].?

Ans:

```
7]: def good():  
    return ['Harry', 'Ron', 'Hermione']  
good()
```

```
7]: ['Harry', 'Ron', 'Hermione']
```

9. Define a generator function called `get_odds` that returns the odd numbers from `range(10)`. Use a `for` loop to find and print the third value returned.?

Ans:

```
8]: def get_odds():  
    for number in range(1, 10, 2):  
        yield number  
count = 1  
for number in get_odds():  
    if count == 3:  
        print("The third odd number is", number)  
        break  
    count += 1
```

The third odd number is 5

10. Define an exception called `OopsException`. Raise this exception to see what happens. Then write the code to catch this exception and print 'Caught an oops'.?

Ans:

```
[19]: class OopsException(Exception):  
    pass  
raise OopsException()
```

```
-----  
OopsException                                Traceback (most recent call last)  
in  
    1 class OopsException(Exception):  
    2     pass  
----> 3 raise OopsException()  
OopsException:
```

```
[20]: try:  
    raise OopsException  
except OopsException:  
    print('Caught an oops')
```

Caught an oops

11. Use `zip()` to make a dictionary called `movies` that pairs these lists: `titles = ['Creature of Habit', 'Crewel Fate']` and `plots = ['A nun turns into a monster', 'A haunted yarn shop']`.?

Ans:

```
[21]: titles = ['Creature of Habit', 'Crewel Fate']  
plots = ['A nun turns into a monster', 'A haunted yarn shop']  
movies = dict(zip(titles, plots))  
movies
```

```
t[21]: {'Creature of Habit': 'A nun turns into a monster',  
       'Crewel Fate': 'A haunted yarn shop'}
```
